

TRANSACTION DATA INTELLIGENCE

Raw transactions, read like a merchant. Understood like a customer.

Finch turns cryptic bank feed strings into clean merchant identity, category, location and behaviour — enriching every transaction for Australia's banks, fintechs and retailers in real time.

100 WORDS

Australian bank feeds still speak in codes. SQ *GRN MRKT SYD is a grocer in Sydney, but the line does not say so. Customers cannot explain their money. Credit models inherit the noise. Retailers cannot see who was paid.

Finch, in Sydney, reads every transaction the way a person would. In under fifty milliseconds a raw string becomes a merchant, a category, a place and a behaviour. One API then powers wellness, affordability, rewards and a live view of the market.

The same primitives. Human review beside the models. 4.2 billion transactions already enriched. The feed, finally, makes sense.

99 WORDS

01

Bank feeds were written for switches, not people.

RAW · BANK FEED	AUD
SQ *GRN MRKT SYD 0426	card
UBER *TRIP HELP.UBER.COM	card
TFR AMZN AU 44118X	transfer
POS SUSHI HUB CBD	point of sale
WWW NETFLIX.COM 899	recurring
DD ORIGIN ENERGY	direct debit

01

Customers can't see their own money.

A truncated merchant string is not a brand, a category, or a place. Wellness features stall on lines nobody can explain.

02

Credit decisions inherit the noise.

Income, bills, subscriptions and affordability are in the history — locked inside descriptions built for settlement, not underwriting.

03

The market stays invisible.

Without a clean merchant, retailers and rewards teams cannot see share of wallet, cohorts, or where spend is actually moving.

02 — ENRICHMENT

The same line, read the way a customer would.

Clean merchant identity, category, location and behaviour attached to every card, direct debit and transfer description — including truncated Australian feeds.

03 — UNDER FIFTY MILLISECONDS

One transaction. Five stages.

Every line through the Finch API is matched, categorised, read for behaviour, and written into aggregated market intelligence.

04 — THE PLATFORM

One API. Three intelligence layers.

A single integration scales from a merchant lookup to a full behavioural layer. Each product uses the same primitives and can be adopted on its own.

01 · Enrichment API

Turn a bank string into a merchant.

Identity, category, location, logo and behaviour across Australian and global card, debit and transfer descriptions.

Merchant name Category Location
Logo & website Recurring Confidence

02 · Analytics API

Understand how a customer spends.

Enriched history becomes income, bills, subscriptions, discretionary versus essential spend, and affordability.

Income Bills Subscriptions Fee saver
Cash-flow Affordability

03 · Intelligence API

See markets and merchants move.

Privacy-preserved signals across the Finch network — category, region, share of wallet and cohort behaviour as a feed.

Spend Retail share Merchants Benchmarks
Geography Alerts

05

Built for the problems Australian financial teams actually have.

Every solution sits on the same enrichment and analytics primitives — a money feature and a credit decision share one underlying dataset.

01	Financial wellness	Customers can't see or explain their own money. Finch returns cash-flow, bills and subscriptions.	+27% engagement in customer money features.
02	Affordability	Underwriting still leans on outdated income snapshots. Finch verifies income and expenditure from live transactions.	Faster credit decisions with lower default rates.
03	Rewards	Generic rewards miss real behaviour. Offers key off identified merchants and category patterns.	Higher activation and repeat redemption.
04	Retail intelligence	Retail teams lack a live view of the Australian consumer. Benchmarks arrive by category, region and merchant.	Sharper merchandising, pricing and expansion.

06

The open banking intelligence layer, held to a bank standard.

CONSUMER DATA RIGHT

Accreditation	CDR-aligned infrastructure
Consent	Fine-grained and revocable
Recipients	ADI, ADR and trusted partners
Purpose	Data minimisation, purpose-bound use

CONTROLS

In transit	TLS 1.3 on every endpoint
At rest	AES-256 for stored datasets
Access	Role-based permissions, immutable audit
Residency	Australian regions · 99.99% SLA

07

Scale that powers Australia's financial data infrastructure.

08 — WHAT PARTNERS SAY

“Finch improved our merchant identification accuracy overnight. Categorisation is a step-change beyond anything we’d built in-house.”

09

Human intelligence and machine learning, one pipeline.

A Sydney data science team designs, monitors and improves the models that classify every transaction — and holds accuracy at enterprise levels.

01

An Australian merchant graph.

1.5 million merchants, with name, category, location, logo and site — built for the way local card, Osko and direct-debit strings are actually written.

02

Accuracy with a human loop.

Models do the volume. People review the edge. That combination is what keeps enrichment at 95% instead of drifting quietly in production.

03

Fast enough to sit in the product.

42ms at the 95th percentile. Sandbox keys in minutes. Production with observability, a 99.99% SLA, and data that stays in Australia.

04

One integration, four problems.

Wellness, affordability, rewards and retail do not need four vendors. They adopt layers of the same API as the use case grows.

10

From a raw file to a personalised experience.

01

Connect

Integrate with the Finch API and stream transaction data securely.

02

Enrich

Every line is matched, categorised and tagged with merchant intelligence.

03

Analyse

Behaviour, income and affordability signals are computed continuously.

04

Personalise

Signals land in products, credit decisions and customer experiences.

Start with your own file.

A free enrichment report, usually back within one business day.

YOU SEND

An anonymised CSV, or a synthetic sample.

YOU RECEIVE

Per-line enrichment, category accuracy, recurring detection.

THEN

A 30-minute walkthrough. Samples stay under NDA and are deleted after.

START WITH FINCH

Turn transaction data into a competitive advantage.

Book a walkthrough. We'll show Finch running on real Australian transaction data and scope a path to production.
